Soares Lab Clone distribution: Researchers may obtain BMAP cDNA clones from RESEARCH GENETICS. It should be noted that Bento Soares is generating a small number of additional specialized non-redundant arrays of BMAP cDNAs whose availability will be considered under appropriate and limited collaborative arrangements The following repetitive elements were found in this cDNA sequence: Seq primer: M13 Forward
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        BF465475 11 October 1 1 October 1 1 October 1

The invention relates to a soluble polypeptide (I) of beta 2

microglobulin (beta2m)/HFE monochain comprising human beta2m (or its
microglobulin (beta2m)/HFE monochain comprising human beta2m (or its
malogue or active fragment), linked to alphal-alpha3 domains of human
HFE (a central regulator of iron absorption; undefined), or its analogue
or active fragment, by a flexible linker peptide, or a functional
HFE (a central regulator of iron absorption; undefined), or its analogue
or active fragment, by a flexible linker peptide, or a functional
consistence or all of (I). (I) is useful for reducing intracellular iron
absorption in patients having hereditary haemochromatcosis, transfersions,
consistence are preferably lymphocytes or leukocytes, across the blood-
brain barrier. (I) is further useful for treating brain tumour. (I)
consistence of the second or chronic infections, and for
consistence of the secular diseases, inflammation, atherosclerosis,
contoinmune diseases and inflammatory conditions. The monochain manifests
as a platform for drug delivery of therapeutic use for cancer,
contoinmune diseases and inflammatory conditions. The monochain manifests
specific characteristics advantageous for drug delivery systems. It is a
soluble, stable and fully conformed protein. It binds specifically to
transferrin receptor. (IfR) and therefore targets cells that over-express
this receptor. It is continuously internalised by the target cells, thus
enabling efficient drug delivery. It dissociates from the receptor in the
cells, minimising side effecte. It negatively regulates iron absorption,
reducing growth of undesired cells and preventing lymphocyte activation.
It is not diluted in the blood as is transferrin. It should not induce an
confundance response since it is a self non-polymeric protein and delivery of
arrian prevention mynesin mensor and any experience in the new page of the service of the se
                                                                                                                                                                                                                                                                           Soluble beta 2 microglobulin/HFE monochain useful for treating iron-overload conditions e.g. thalassemia and chronic infections, comprises human beta 2 microglobulin linked to alpha domains of HFE by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         natural TfR-binding protein. The present sequence represents the coding sequence of beta2m/HFB monochain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    181
```

This cDNA clone, designated cDNA24, is derived from human gene whose mutated form is associated with hereditary haemochromatosis (HH). It was obtained from a directionally cloned plasmaid-based cDNA library following identification of the HH locus in the HLA region of chromosome 6. A single mutation (24d1) in the HH gene appears responsible for the majority of HH disease. This comprises a G to A substitution that is present in 86% of affected chromosomes and in 4% of unaffected chromosomes. It results in a chromosomes and in 4% of unaffected chromosomes. It results in a chromosomes and in 4% of unaffected chromosomes. It results in a critical disulphide bridge important for secondary structure. The following are claimed: a 10825 by genomic DNA sequence (1) (see following are claimed: a 10825 by genomic DNA sequence (1) (see following are claimed: a cloning or expression vector; host cells; a peptide product chosen from the HH gene product, its variants can an antibody produced using the peptide; a method to determine the presence or absence of the common HH gene mutation; an animal model for the HH disease; metal chelation

- useful for diagnosis

Hereditary haemochromatosis gene and variants - usefi and treatment of hereditary haemochromatosis disease

agents, T-cell differentiation factors and therapeutic agents for the mitigation of injury due to oxidative process in vivo or mitigation of iron overload, a method for screening potential therapeutic agents for activity in connection with HH disease, an antisense oligomucleotide directed against a transcriptional product of a nucleic acid sequence as above; and oligomucleotides or pairs of oligomucleotides covering a range of nucleotides from (I), (Ia) or their variants, useful for detecting a polymorphism in the HH gene. The invention also relates to methods for screening for HH homozygotes, to HH diagnosis, prenatal screening and diagnosis, and therapies of HH disease, including gene therapy,

                                                                                                                                                                                                                                                                                                                                                      9
                                                                                             The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cal differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           256
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            316
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence encodes a human histocompatibility iron loading (HFE) protein. The HFE gene is a major histocompatibility (MHC) non-classical class I gene located on chromosome 6p. Mutations in the gene lead to iron disorders. The specification describes a method for diagnosing an iron disorder or a genetic susceptibility to develop the disorder in a mammal. The method comprises determining the presence of a mutation in exon 2 or an intron of a HFE gene or protein. The mutation is not a C to G missense mutation at nucleotide 187 of the sequence given in A96769 (Genbank Accession number 160319). The presence of the mutation indicates the disorder or the genetic susceptibility to the disorder. The method is used to diagnose an iron disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Diagnosing an iron disorder e.g. hemochromatosis or a genetic susceptibility to develop it, by determining the presence of a mutation in exon 2 or an intron of a histocompatibility iron loading nucleic
f
"if this base is mutated to C, then the
protein contains the mutation I105T, which
is associated with an iron overjoad disorder"

Powell LW;

Jazwinska EC,

This sequence represents the haemochromatosis (HC) gene. Mutations in this sequence are detected using the method of the invention. The method is for identifying an individual with hereditary haemochromatosis (HH) or a predisposition to develop HH or to genetically pass on HH to an offspring, comprising isolating a biological sample and amplifying a region of genomic DNA in the biological sample encompassing all or part of the DNA between markers D65255 and D65276, and detecting at least one homozygous or heterozygous mutation in a nucleotide within the region. The method can also be used for identifying an individual with an cutosomal recessive disorder (ARD) or predisposition to develop and/or genetically pass on an ARD to an offspring, comprises isolating a biological sample from the individual and screening genomic DNA in the sample for the presence of a homozygous or heterozygous mutation in a gene, the normal function of which, is required to prevent progression of the disorder. The method(s) can be used to identify individuals that are homozygous or heterozygous (carriers) for the mutation causing the ARD. Especially the method is used to diagnose HH or predisposition to HH by detecting a Cys282Tyr substitution. Individuals homozygous for this

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               121 GCCGTGTGGAGCCCCCGAACTCCATGGGTTTCCAGTAGAATTTCAAGCCAGATGTGGCTGC 180
To identify this novel gene, allelic association patterns were determined between known markers and the HH locus in the HLA region of chromosome 6. A physical clone coverage was then generated extending from D6S265, which is a marker that is centromeric of HLA-A, in a telomeric direction through D6S276, a marker at which control of the allelic association was no longer observed. A single mutation (24d1) in the HH gene appears responsible for the majority of HH disease. This comprises a Cto A substitution that is present in casella in a Cys to Tyr substitution in the encoded protein (see AAW36499) at a critical disulphide bridge important for secondary is tructure. The following are claimed: the HH genemic DNA (1), a structure. The following are claimed: the HH genemic DNA (1), a structure a cloning or expression vector; host cells; and 24d7 variants; a cloning or expression vector; host cells; a structure and 24d7, or a peptide of at least 56 amino acid cesiques of these; an antibody produced using the peptide; a method cesiques of these; an antibody produced using the peptide; a method cesiques of these; an antibody produced using the peptide; a method cesiques of these; an antibody produced using the peptide; a method cesiques of these; an antibody produced using the peptide; a method cesiques of the mitigation of injury due to oxidative process in vivo or the mitigation of injury due to oxidative process in vivo or the mitigation of injury due to oxidative process in vivo or the mitigation of injury due to oxidative process in vivo or the mitigation of injury due to oxidative process or vivo or the mitigation of injury due to oxidative process or vivo or the mitigation of injury due to oxidative process or vivo or the mitigation of injury due to oxidative process or vivo or the mitigation of injury due to oxidative process or vivo or the mitigation of injury due to oxidative process or vivo or the mitigation of injury due to oxidative process or pairs of oligonucleotide directed against a transcriptional cor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             3762 GITCACACTCTCTGCACTACCTCTTCATGGGTGCCTCAGAGCAGGACCTTGGTCTTTCCT

                                                                                                                                                                                                                                                                            The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cal disferentiation factor, and for alleviation gron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

The HFE gene is a major histocompatibility (MHC) non-classical class I gene located on chromosome 6p. Mutations in the gene lead to iron disorders. The specification describes a method for diagnosing an iron disorder or a genetic susceptibility to develop the disorder in a mammal. The method comprises determining the presence of a mutation in exon 2 or an intron of a HFE gene or protein. The mutation is not a C to G missense mutation at nucleotide 187 of the sequence given in A96769 (Genbank Accession number U60319). The presence of the

unaffected by hereditary haemochromatosis (HH). Also described is a method to determine the presence or absence of the common hereditary haemochromatosis (HFB) gene mutation in an individual comprising:

C an providing DNA or RNA from the individual; and (b) assessing the DNA or RNA for the presence or absence of the haplotype or genotype where the presence or the HFB gene mutation in the genotype indicates the likely presence of the HFB gene mutation in the genome of the individual. The HFB gene sequences from the present invention can be used to develop products for use in the diagnosis and treatment of HFB. The present including and betyrophilin (BT), and can be used in the production of agonists and antagonists of BT function. Also described are: (1) a RoRet gene which can be used to develop products for the study, diagnosis and treatment of lupus and Sjogren's syndrome; and (2) NPT3 and NPT4 genes which are homologues of a type I sodium transport gene, and can can similarly be used for hypophosphatemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           43208 AGCTGAGTCAGAGTCTGAAAGGGTGGGATCACATGTTCACTGTTGACTTCTGGACTATTA 43149

The products from the human haemochromatosis gene. The present sequence represents a hereditary haemochromatosis gene. The present sequence represents a hereditary haemochromatosis subregion from an hereditary haemochromatosis subregion from an hereditary haemochromatosis (HFB) gene mutation in an individual comprising:

C above the presence or absence of the common hereditary haemochromatosis (HFB) gene mutation in an individual comprising:

C above the presence or absence of a haplotype or genotype where the presence or absence of the proportype or genotype indicates the likely presence of the HFB gene mutation in the genome of the individual. The the presence of the Present invention can be used to develop products for use in the diagnosis and treatment of HFB. The present invention also describes BTF genes, which are homologues of the milk products for use in the diagnosis and treatment of HFB. The present invention also describes BTF genes, which are homologues of the milk protein butyrophilin (BT), and can be used in the production of agonists of and antagonists of BT function. Also described are: (1) a Roket gene which can be used to develop products for the study, diagnosis and treatment of lupus and Sjogren's syndrome; and (2) NPT3 and NPT4 genes while hard, he used for hymonlogues of a type 1 sodium transport gene, and can can

                                                                                                                                                                                                                                                                                                                                        The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

                                                                                                                                                                                                                                                                                                              The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     298 GTTCACACTCTCTGCACTACCTCTTCATGGGTGCCTCAGAGCAGGACCTTGGTCTTTCCT

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
